PREMIUM AFTER EFFECTS E-COMMERCE VIDEO EDITING

Visual analysis, editing techniques, workflow skills, sound-design plan and screenshot references

Materials reviewed

1. “How to edit Viral Reels in After Effects — COMPLETE Guide” (uploaded MP4, approx. 58 min 52 sec).
2. “Minimalist Reels Editing in After Effects — Full 40-Minute Masterclass” (uploaded MP4, approx. 42 min 21 sec).

Important scope note: These are tutorial/screen-recording videos, not isolated final e-commerce ad exports. The report identifies techniques visible in the tutorial previews and timelines. The two Facebook share links from the earlier message could not be fetched in this session, so their exact content could not be independently verified. Exact third-party sound-library catalogue IDs cannot be recovered from a finished mix unless the source asset names or library metadata are shown. The sound IDs below are clearly marked *suggested production labels*, not original library codes.

1. Executive summary

The two tutorials demonstrate a useful foundation for premium vertical ads: clean composition, animated typography, product/object movement, shape-based transitions, layered scenes, controlled easing, and staged reveal sequences. The second tutorial leans toward minimalist warm-toned design and offer/number animation; the first includes high-contrast black-and-white graphic layouts, object motion, circular/label-style compositions, and kinetic text. These techniques can be adapted to e-commerce product ads, where the product should remain the hero and each motion beat should support a feature, price, benefit, or call to action.

Best-fit e-commerce style: 9:16 vertical master; strong first 1–2 seconds; one visual message per beat; consistent brand palette; readable typography; subtle depth/shadows; crisp product cut-outs; sound accents synchronized to movement; and a clean end card.

2. Technique inventory

Technique / skill	Evidence in tutorial screenshots	E-commerce application
Kinetic typography	Text blocks and words animated/repositioned across compositions; title cards appear in both tutorials.	Animate product name, offer, benefit and CTA with short position/scale/opacity moves.
Shape layers & vector graphics	Graphic shapes and abstract curved/organic forms are visible in the comps and timeline.	Create wipes, circles, underlines, badges, price tags and background accents.
Masking / matte reveals	Layered graphic objects enter/exit through overlapping shapes; exact matte settings are not always legible.	Reveal product packaging or a feature label without a hard cut.
Position / scale / rotation keyframes	Objects and design elements are moved around vertical comps; transform controls are visible.	Build product entrance, floating packshot, orbiting icon and close-up transitions.
Motion paths & spatial animation	Selected objects show transform handles/path controls in the first tutorial.	Use deliberate paths for floating products, ingredient/object movement, and callouts.
Easing / Graph Editor principles	Curved speed/value graph is visible in the first tutorial; timeline keyframes are shown.	Ease in/out, overshoot sparingly, keep movement fast but not abrupt.
Layer sequencing & timing	Multiple colored timeline layers and staggered durations are visible in both videos.	Sequence hook → product reveal → benefits → offer → CTA.
Typography hierarchy	Large display words and smaller supporting copy appear in the final designs.	Use one headline, one support line, and one action; preserve mobile legibility.
Composition & negative space	Minimalist backgrounds, centered focal objects, and intentional whitespace are recurring.	Keep product silhouette clear and avoid clutter around prices and labels.
Color / background treatment	Warm cream/orange palettes in tutorial 2; stark black/white contrast in tutorial 1.	Adapt background to brand; use subtle gradients, vignettes and controlled contrast.
Layered depth / shadows	Objects appear separated from backgrounds with dimensional styling; exact effect stack is not fully readable.	Use contact shadows, soft drop shadows and restrained parallax for premium polish.
Precomps / reusable elements	Layer groups and nested/timeline structures suggest organized scene building.	Precompose reusable product, text, logo and CTA modules for faster revisions.
Vertical delivery / safe margins	Portrait 9:16 layouts are visible in both tutorial projects.	Keep critical text away from app UI overlays and ensure product stays inside safe area.

Note: This is a visual analysis of techniques that can be reasonably inferred from sampled frames. Some effect names, plugins, and parameter values are not legible at this resolution and should not be treated as verified.

3. Video-by-video analysis

Video A — Viral Reels guide (approx. 58:52)

Visible workflow: builds a portrait composition with graphic elements; animates text and object cut-outs; uses transform controls and motion paths; develops layered poster-like scenes; switches between light and dark designs; and shows timeline/keyframe work. A visible curve/graph around the later-middle section supports the inference that easing/velocity shaping is part of the workflow. The designs use contrast, scale and timing to create visual emphasis.

Skills to reproduce: clean layer naming, anchor-point placement, shape-layer construction, masking, keyframe interpolation, path animation, typography timing, scene transitions, graphic hierarchy, and final composition review.

Video B — Minimalist Reels masterclass (approx. 42:21)

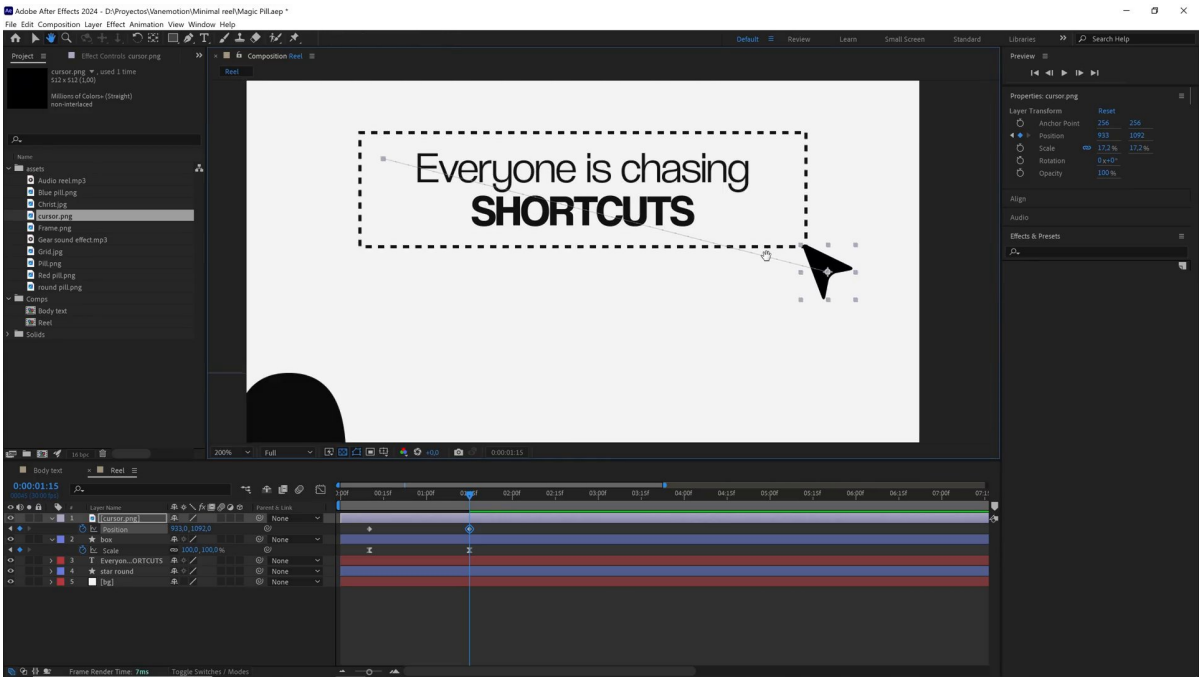

Visible workflow: builds warm, minimalist vertical compositions; animates a central product/illustration and surrounding decorative elements; reveals large numbers/offer-style text; uses abstract curved shapes and a grid-like background; and layers elements in a staggered timeline. The style is restrained, with generous negative space and a consistent cream/orange palette.

Skills to reproduce: minimalist art direction, product staging, number/offer animation, shape-based transitions, background texture/grid treatment, controlled layer overlap, consistent palette, and pacing that lets each message read.

4. Screenshot evidence

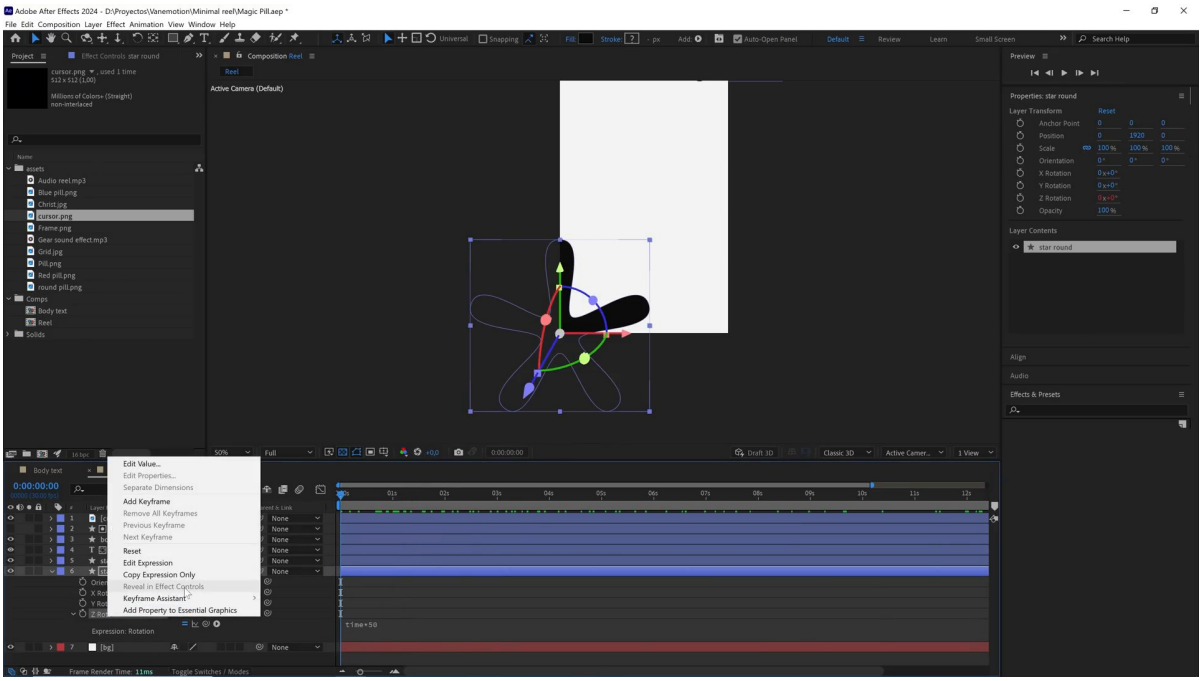

Screenshots are sampled directly from the uploaded tutorial files. Timestamps are approximate positions in each source video.

Video A — 06:00

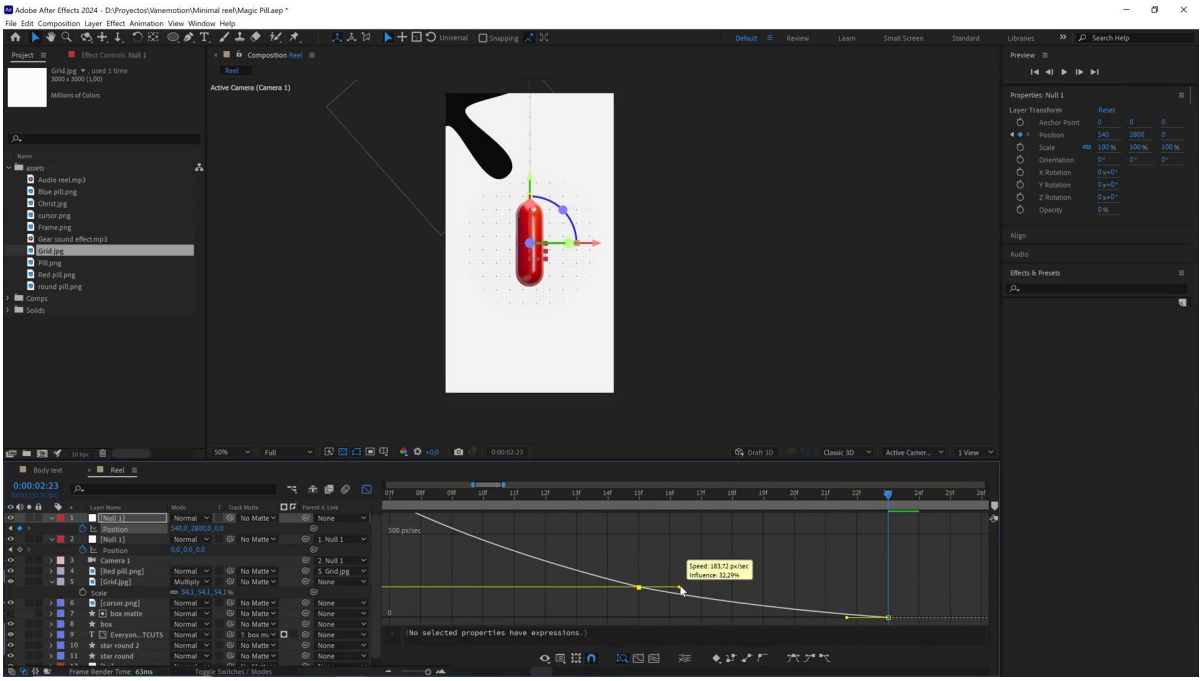

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 09:00

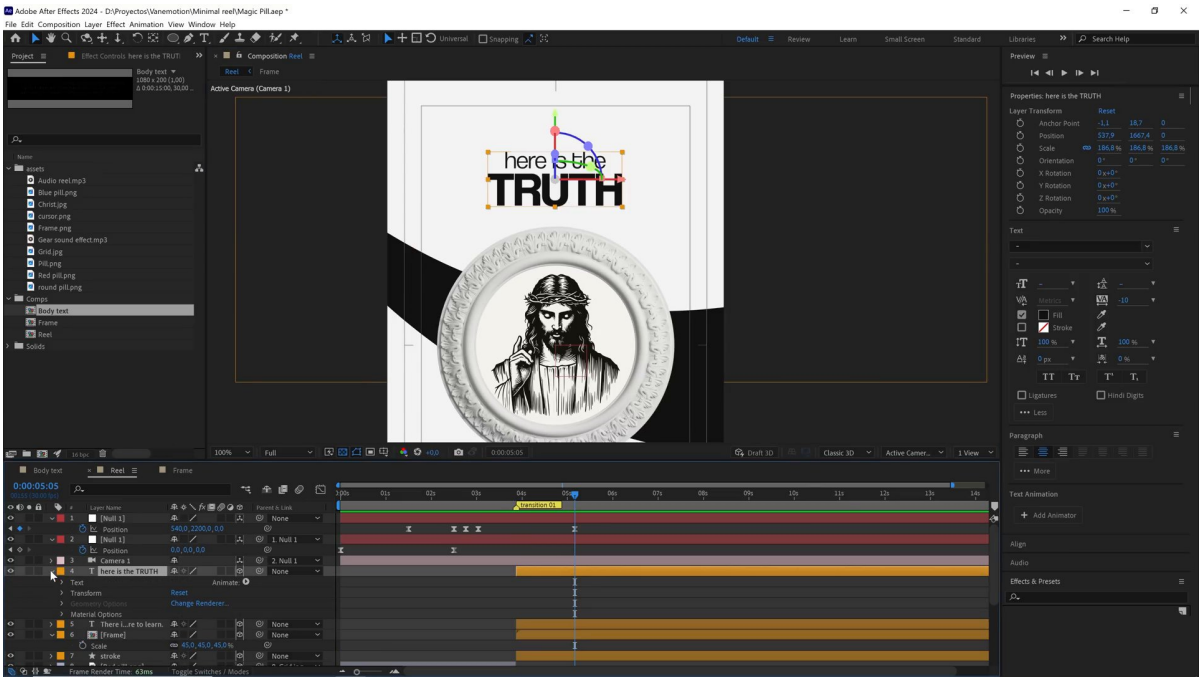

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 15:00

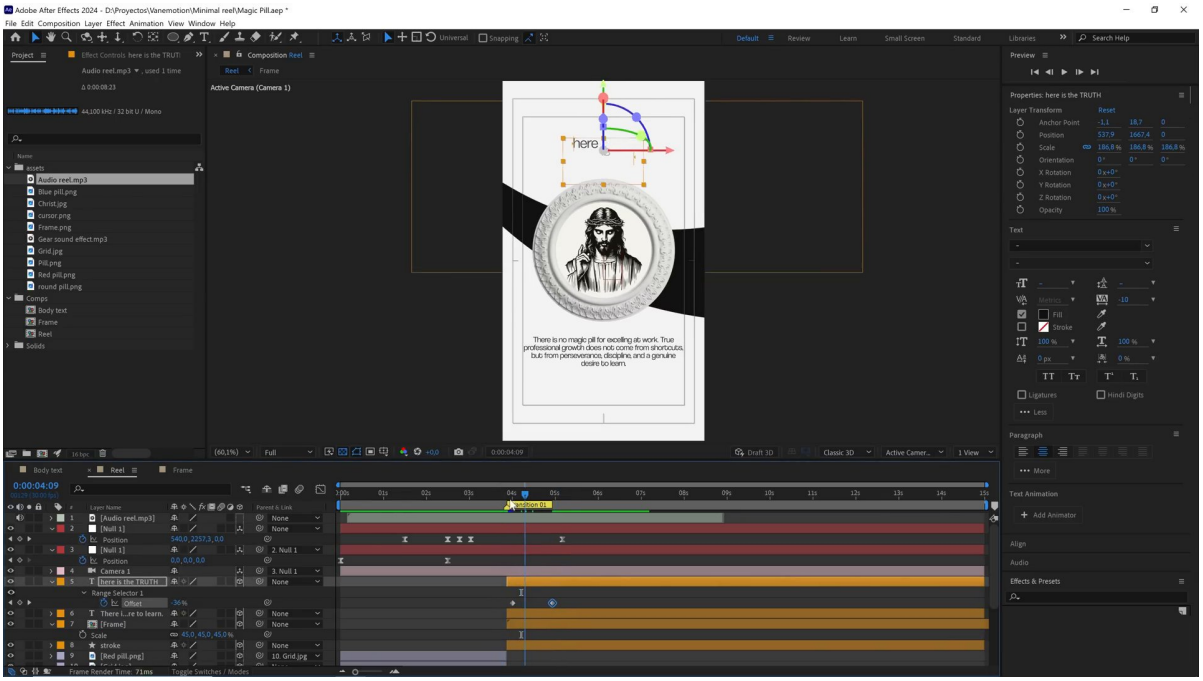

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 25:00

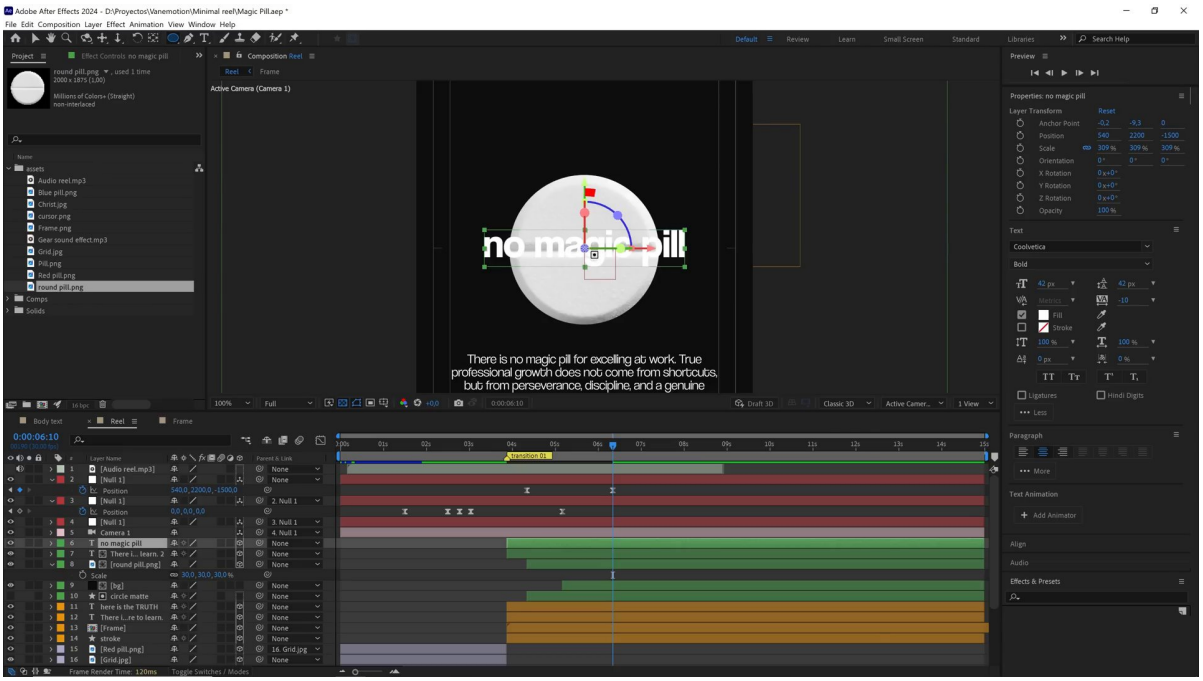

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 27:00

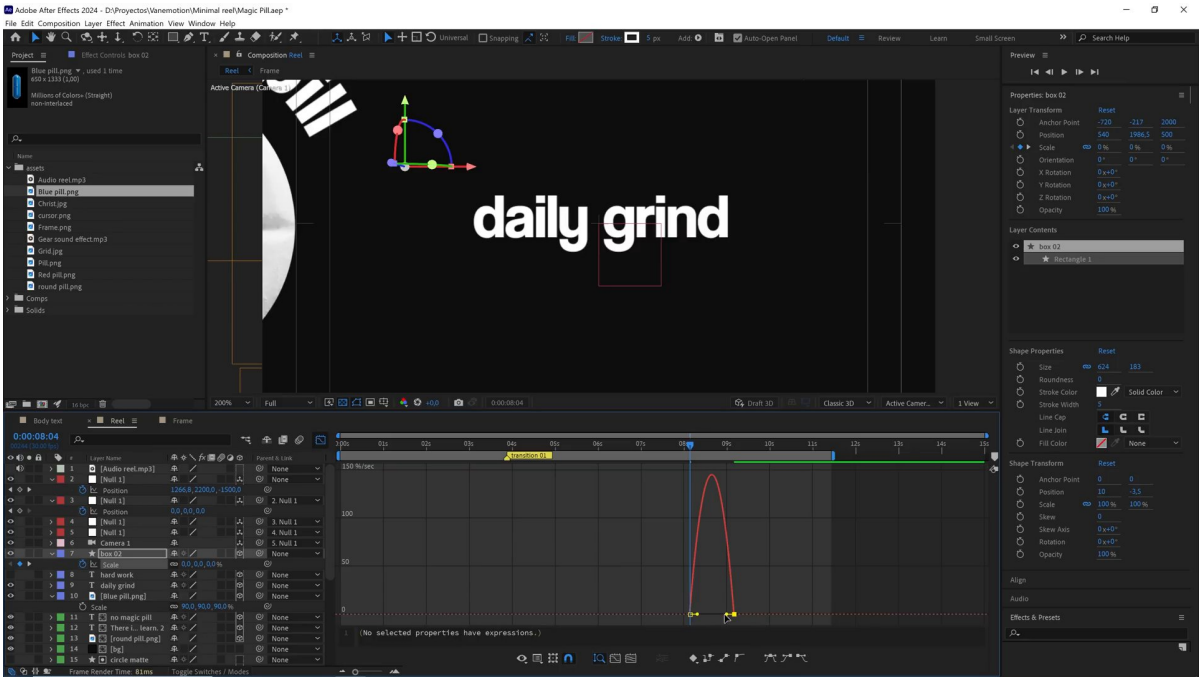

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 35:00

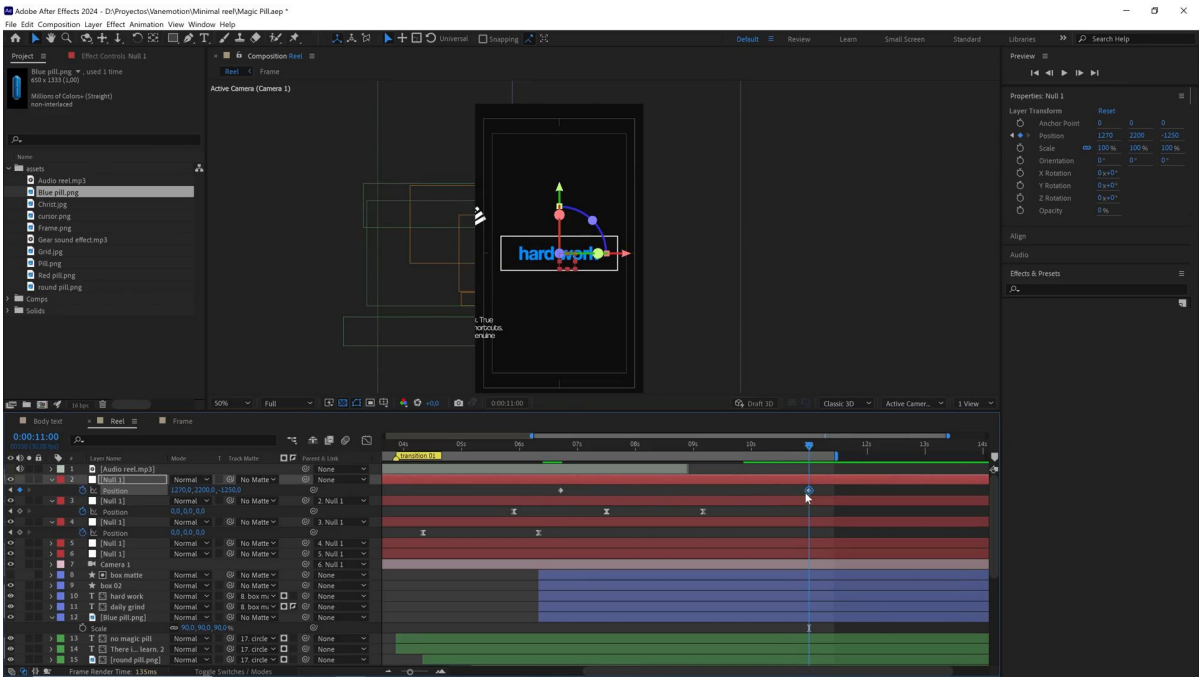

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 42:00

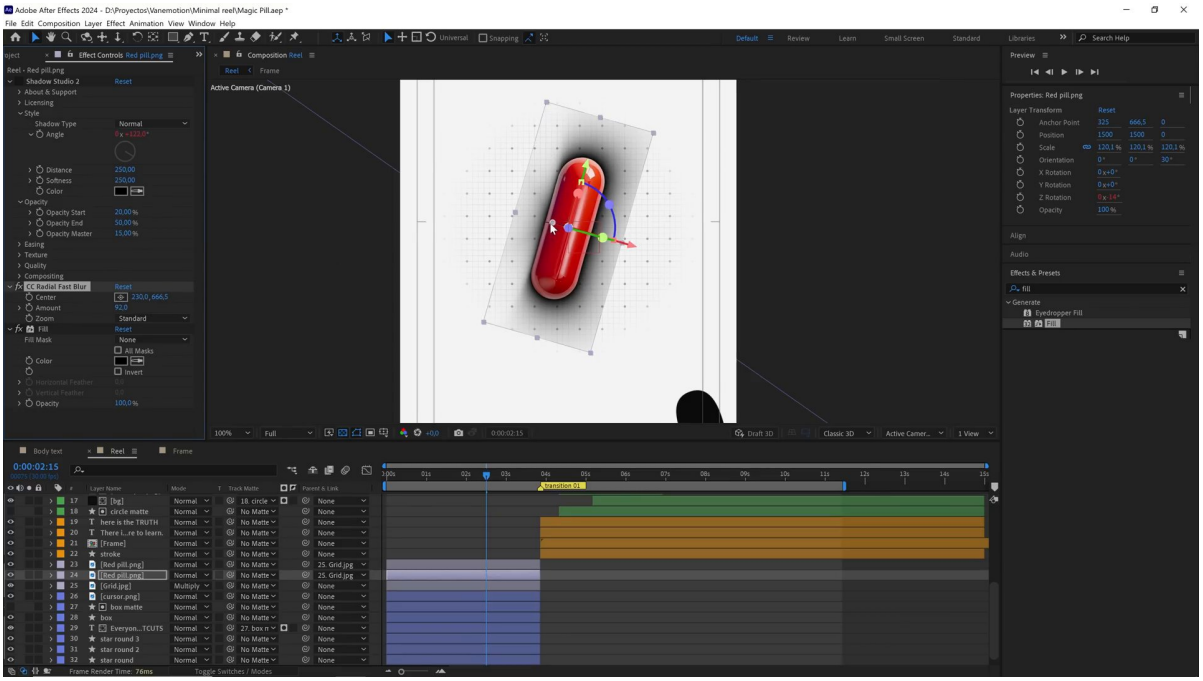

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 45:00

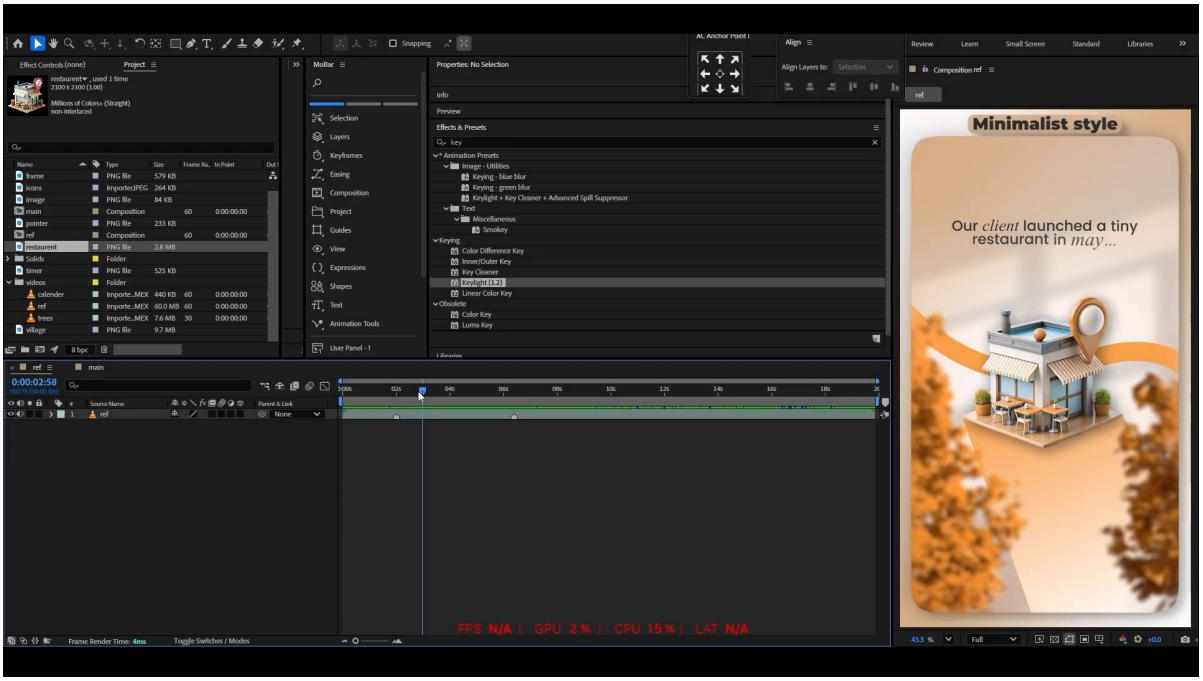

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video A — 55:00

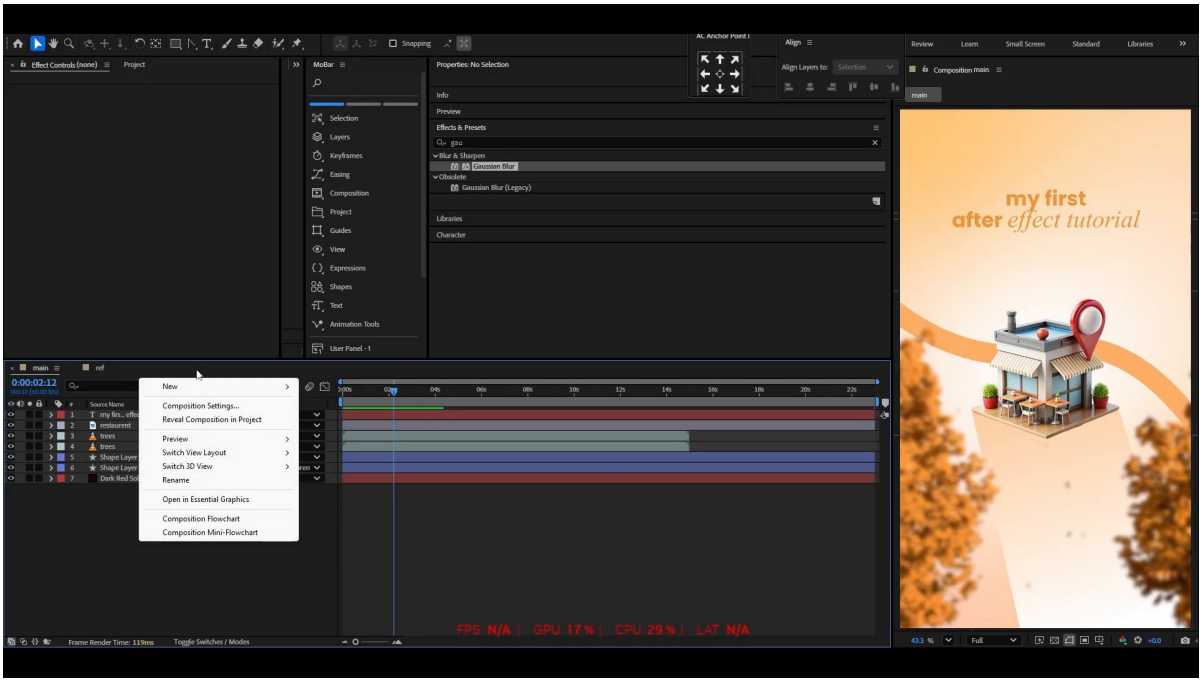

Viral Reels tutorial: visible composition, selected layers, transform/path controls, typography or timeline.

Video B — 03:00

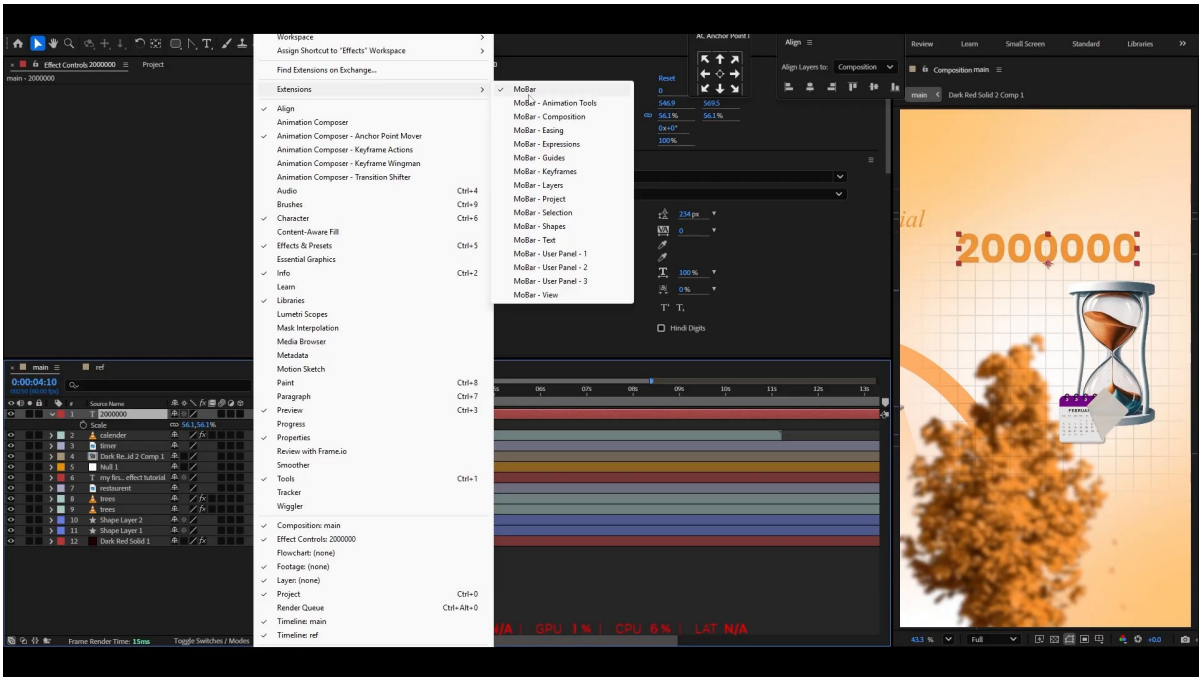

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 06:00

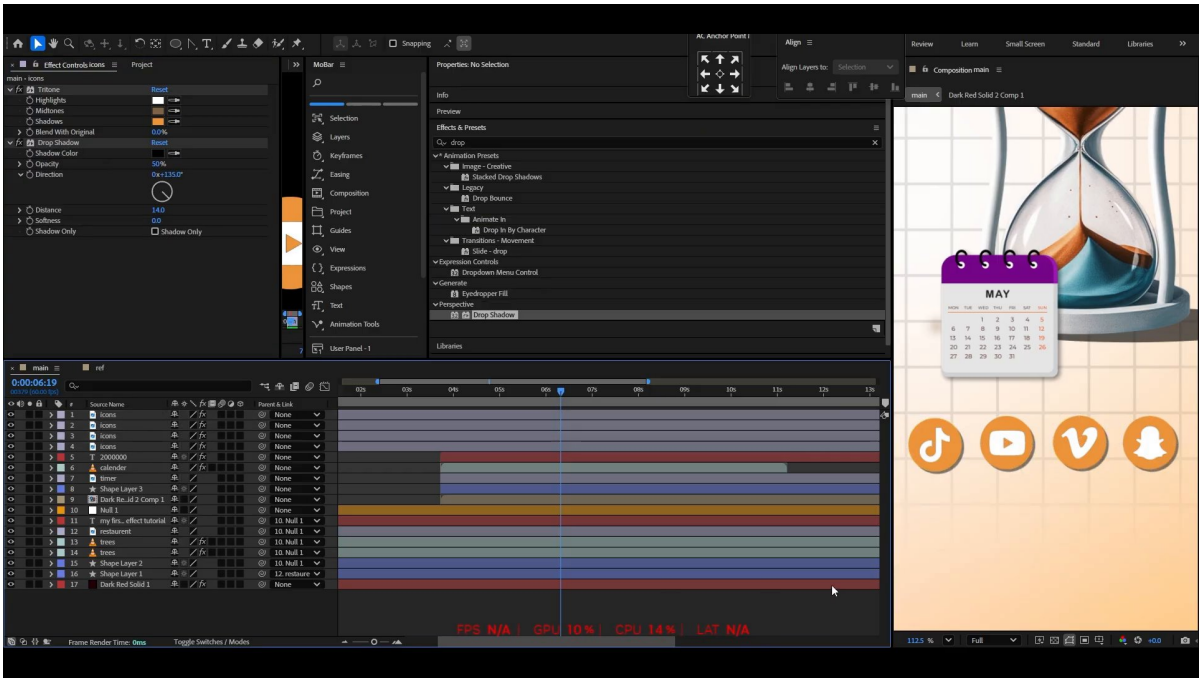

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 09:00

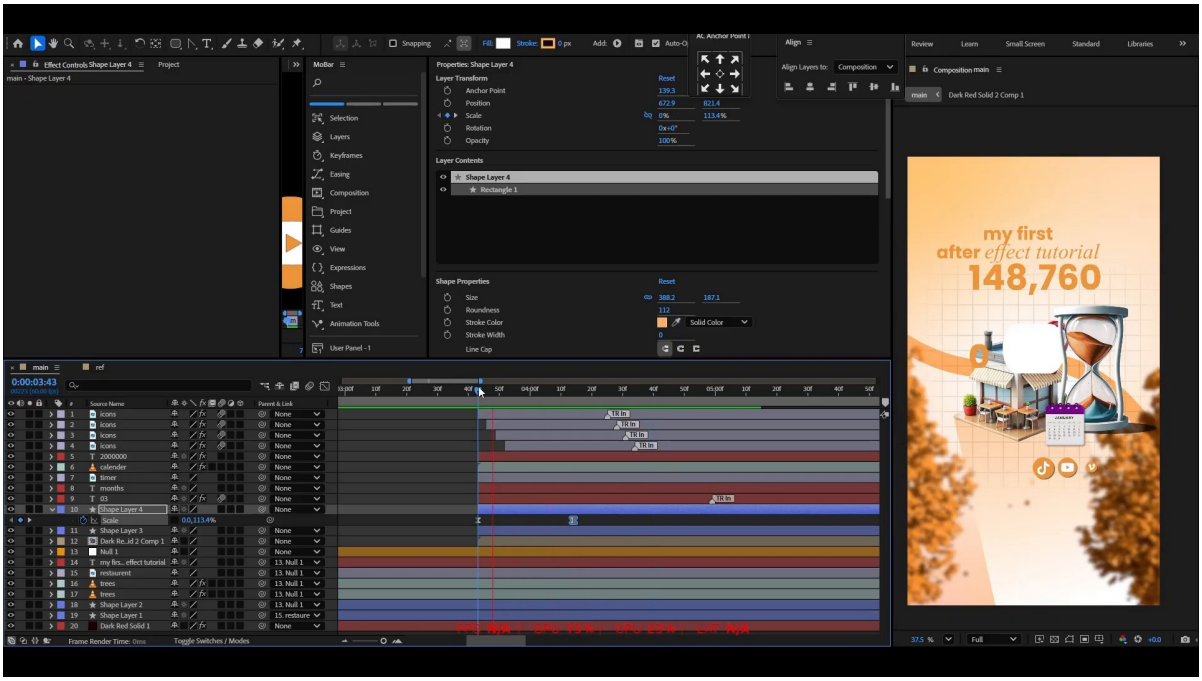

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 12:00

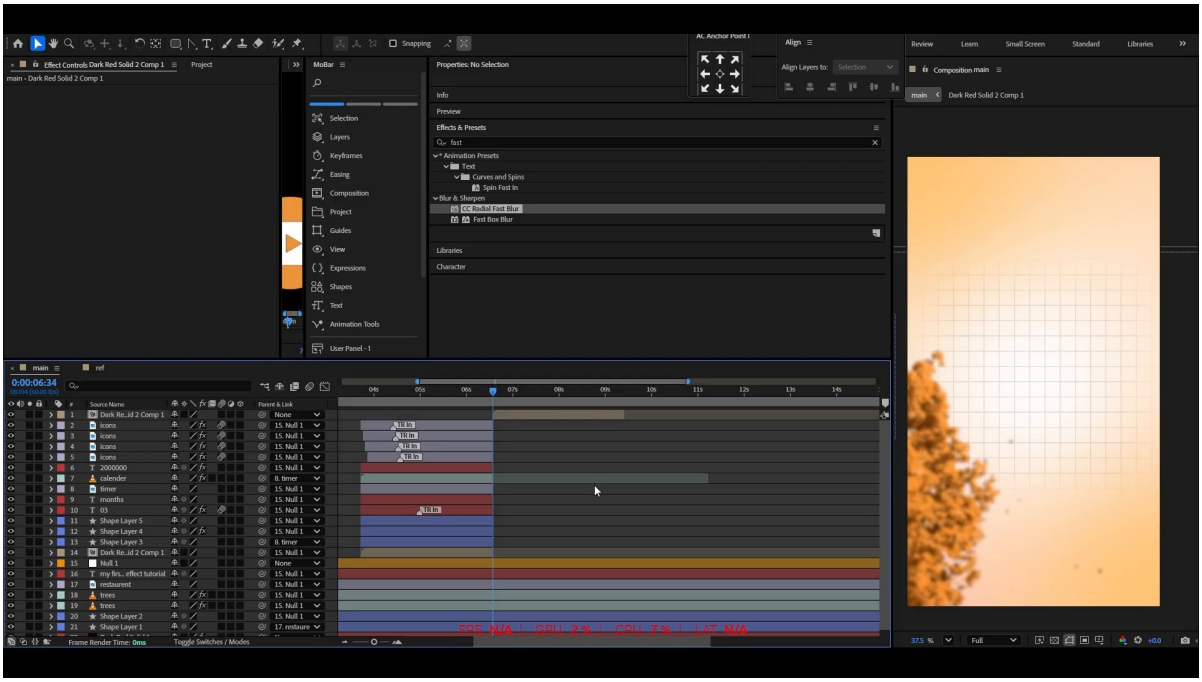

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 15:00

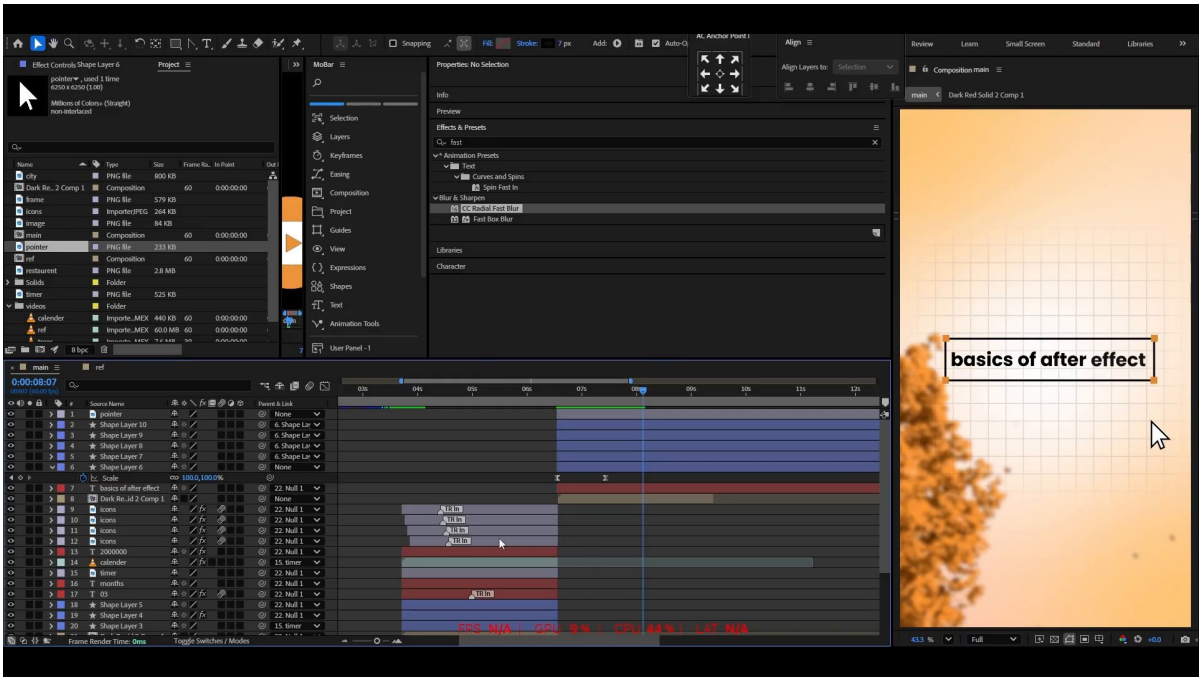

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 18:00

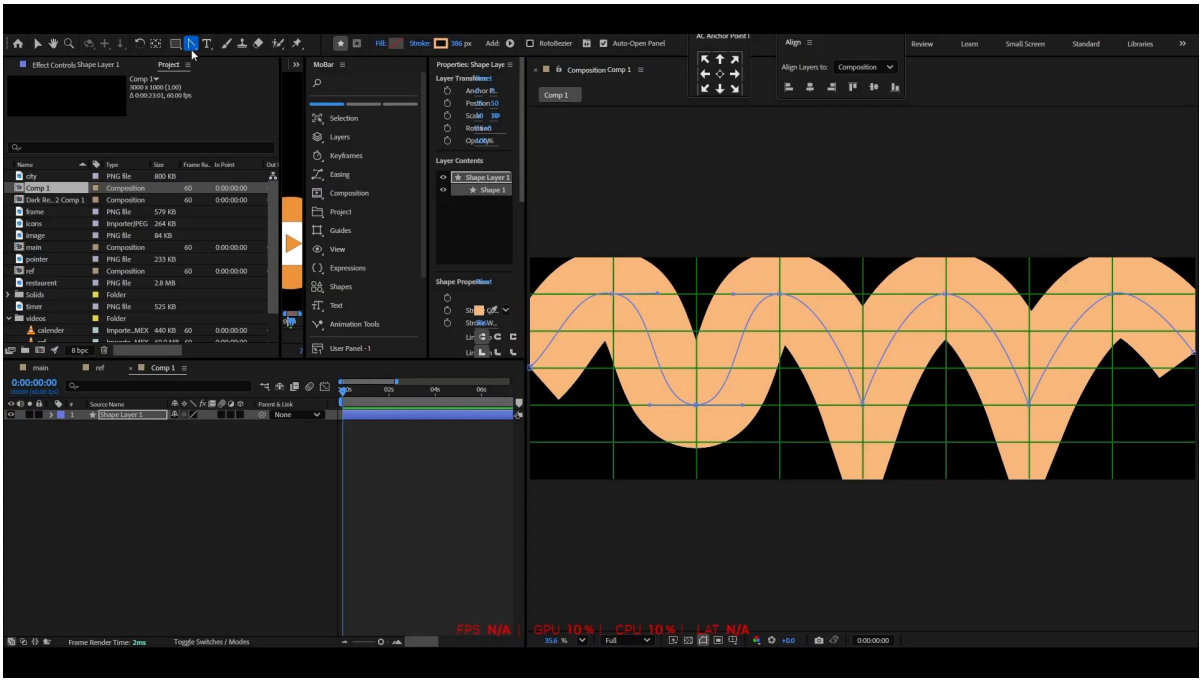

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 21:00

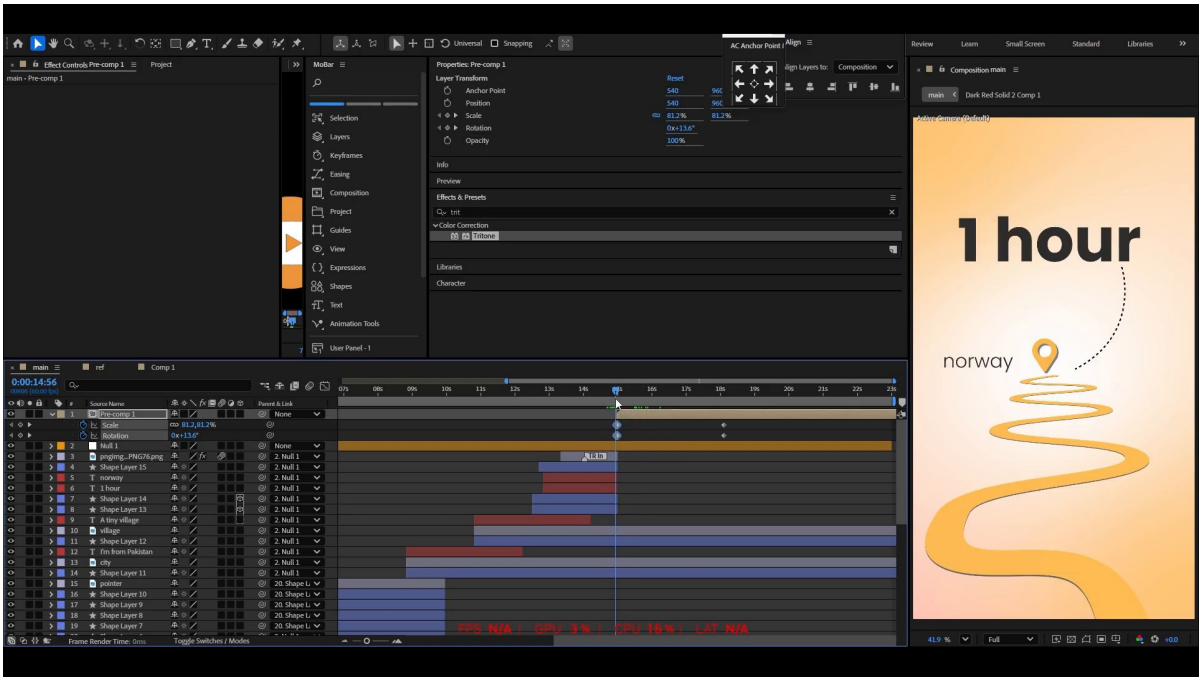

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 30:00

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

Video B — 38:00

Minimalist Reels tutorial: warm vertical composition, product/shape animation, typography and staggered timeline.

5. Sound design analysis & suggested SFX cue sheet

The supplied files are tutorials with screen capture and tutorial audio; they do not provide a clean, isolated final e-commerce soundtrack or visible sound-library metadata. Because of this, individual audible events cannot be matched confidently to an original sound asset or stock-library ID from the video alone. The cue sheet below is a practical design plan for reproducing the style in an e-commerce edit. The codes are project labels for your editor/library—not verified catalogue codes from the reference videos.

Suggested code	Sound-effect name / search description	Where to use it	Mix / edit note
SFX-01	Soft whoosh / short airy swipe	Text or product enters; fast scene transition	Short, bright, low in level; align the transient with motion.
SFX-02	Reverse swell / reverse whoosh	Pre-reveal before hero product or offer	Build for 150–400 ms, then cut into the reveal.
SFX-03	UI pop / soft click	Icon, feature badge, small label appears	Keep light and precise; avoid using on every element.
SFX-04	Low, muted impact / soft thump	Hero product lands or headline locks into place	Use a short low-end hit; avoid excessive bass on phone speakers.
SFX-05	High tick / digital blip	Small icons, counters, UI elements, feature callouts	Use sparingly and vary pitch slightly.
SFX-06	Subtle shimmer / sparkle	Premium highlight, glossy reveal, key benefit	High-frequency accent; keep very quiet.
SFX-07	Swipe / paper-like swish	Shape wipe or card transition	Match direction and duration to the visual wipe.
SFX-08	Riser / short tonal build	Lead-in to price, discount or CTA	Keep short; resolve exactly on the reveal.
SFX-09	Soft logo sting / tonal chime	Brand logo or end card	One distinctive sound; leave space after it.
SFX-10	Room tone / soft ambient bed	Background under product shots	Low volume; duck under voiceover if present.
SFX-11	Beat hit / rhythmic accent	Cuts aligned to music or repeated product features	Use only when rhythm supports the edit; avoid over-cutting.
SFX-12	Soft click / button press	CTA button or final action prompt	Place at the moment the button animates or settles.

How to obtain exact sound-effect catalogue numbers: open the original project or ask the editor for the imported audio filenames; check the source library/download history; or compare each sound against the same library's catalogue. Do not label these suggested SFX codes as original IDs. If you provide the separate final ad export or the audio files, a more precise cue-by-cue timing sheet can be prepared.

6. Suggested After Effects workflow for an e-commerce ad

1. Set the comp to 1080 × 1920 (9:16), choose the frame rate to match delivery, and establish safe margins.

2. Build the hero product as a clean cut-out; separate foreground, shadow and background where possible.

3. Animate the product first using Position, Scale and Rotation; set the anchor point intentionally.

4. Use Easy Ease and refine the Graph Editor for controlled acceleration and settling. Avoid identical easing on every layer.

5. Create text as separate layers. Animate headline, benefit, price and CTA in a clear reading order.

6. Use shape layers or masks for wipes, badges and reveal mattes. Keep transitions tied to the product movement.

7. Precompose repeatable modules (logo, product, price badge, CTA) and keep layer names organized.

8. Edit sound to motion: transient on landing, whoosh on travel, click on UI/CTA. Keep SFX below music and voice.

9. Review at phone size; check readability, product visibility, brand consistency and end-card duration.

10. Export a high-quality master, then verify compression, audio peaks and text safe areas on a phone.

7. Recommended sound mix and timing

Use one main music bed and only a few intentional accents. A practical hierarchy is voiceover (if any) first, music second, and sound effects as short accents. Place SFX on the visual event rather than slightly before or after it, unless using a deliberate reverse swell. Avoid stacking multiple whooshes, impacts and clicks on one movement. Check the mix on headphones and a phone speaker; keep peaks clean and avoid clipping.

Example 15-second structure

Time	Visual beat	Suggested audio
0.0–1.5 s	Hook / product silhouette or bold headline	Short reverse swell → soft impact
1.5–4.0 s	Hero product reveal / first feature	Whoosh on entrance; low music beat
4.0–8.0 s	Two or three benefits / close-up details	Small UI pops or ticks, not on every word
8.0–11.5 s	Offer / price / proof point	Short riser into a clean impact
11.5–15.0 s	Logo + CTA end card	Soft click or logo sting; let the end card breathe

8. Limitations & confidence

High confidence: portrait compositions, text-led layouts, layered timeline editing, product/object animation, shape-based graphic design, and the broad stylistic differences between the two tutorials. Moderate confidence: use of masks/mattes, easing and precomposition based on visible controls and timeline structure. Not verified: exact plugin names, numerical effect settings, original stock SFX filenames, catalogue codes, and exact sound-to-frame cue timing. The Facebook share links were blocked from direct retrieval, so they are not represented as independently analyzed sources in this PDF.

Prepared as a practical production reference. Suggested SFX codes are internal labels only.
